DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35
 U.S.C. 102 that form the basis for the rejections under this section made in this
 Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors

Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology

Technical Amendments Act of 2002 do not apply when the reference is a U.S.

patent resulting directly or indirectly from an international application filed

before November 29, 2000. Therefore, the prior art date of the reference is

determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre–

AIPA 35 U.S.C. 102(e)).

Art Unit: 2682

Claims 23-24 and 27 are rejected under 35 U.S.C. 102(e) as being anticipated by Taenzer et al (6,603,860).

As per claim 23, see figure 1A and col. 3, line 53 to col. 4, line 18, Taenzer et al discloses an apparatus (see figure 1A) comprising:

a wearing garment including the clothing worn by a user and a conductive fiber (20), namely essential substance (20) laying over at the user's shoulder, forming an induction loop; and

an activator unit (18) arranged to establish electrical conduction, via the induction loop, and to serve as an interface between the garment and a portable electronic device (24).

As per claim 24, Taenzer et al discloses that the garment and said portable electronic device are in electrical interface utilizing a wireless connection (see figure 1A).

As per claim 27, see figure 1A and col. 3, line 53 to col. 4, line 18, Taenzer et al discloses an apparatus (see figures 1A and 1B) comprising:

an inductive coil formed by a conductive fiber (20) for coupling a hearing device to a wearing garment which includes the clothing worn by a user and the conductive fiber (20) forming an induction loop;

a speaker (10) for conveying a message from a portable electronic device (24) to a hearing device (12) of a user; and

an activator unit (18) for establishing a connection between the portable electronic device and the induction loop.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 25 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Taenzer et al.

As per claims 25 and 26, Taenzer et al does not disclose whether the electrically conductive fiber (20) includes a metallic material including either

one of copper, gold, steel, iron, etc. However, these materials are well-known in use for generating magnetic fields, and the examiner takes Office Notice.

Therefore, for an application, it would have been obvious for a person skilled in the art, when carrying out Taenzer et al invention, to select metallic material as either one of these materials being on the basis of the suitability for intended use for the conductive fiber (20) in generating the magnetic field (26).

3. Claims 1-3, 7-10, 12-14, 17-20 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Taenzer et al in view of Peterson (2002/0084990).

As per claims 1 and 13, see figure 1A and col. 3, line 53 to col. 4, line 18, Taenzer et al discloses a process and an associated apparatus, (see figure 1A) comprising:

a garment worn by a user (16);

electrical fibers (20) in a predetermined pattern to form an induction loop; and

Art Unit: 2682

an activator unit (18) arranged at a predetermined location on the induction loop to establish electrical connection and activate the induction loop, and to provide an interface to a portable electronic device (24).

Taenzer et al does not disclose that the electrical fibers (20) is integrated into the garment. He discloses that the electrical fibers (20) are worn over on the garment (see figure 1A).

Peterson teaches that an electrical device worn by a user can be integrated into a garment worn by the user for avoidance of disadvantages such as being awkward, getting in the way of the user, etc, (see section [0025]).

It would have been obvious that a person skilled in the art, when carrying out Taenzer et al invention, could apply Peterson teaching by implementing the electrical fibers (20) to be integrated into a garment worn by a user (16), for avoidance of disadvantages such as being awkward, getting in the way of the user, etc.

As per claim 2, Taenzer et al discloses that the garment corresponds to a shirt (see figure 1A).

Art Unit: 2682

As per claim 3, Taenzer et al in view of Peterson discloses that the electrically conductive fibers can be sewed into the garment (see Peterson, section [0025]). In Taenzer et al invention, in view of Peterson, the electrically conductive fibers inherently must be formed as an induction loop for generating the magnetic field (26) (see Taenzer et al, figure 1A).

Claims 7 and 17 are rejected with similar reasons set forth above for claims 25 and 26.

As per claims 8 and 18, Taenzer et al discloses that the activator unit comprises a power source (inherently included to provide power for the activator unit), a microphone (see col. 3, lines 60–62), electronic processors (FM receiver, amplifier, etc) (see col. 3, lines 60–62), and an interface which provide appropriate connection to close the induction loop and to the portable electronic device, via a wireless transmission (see figure 1A, and col. 3, line 65 to col. 4, line 7).

As per claims 9 and 19, Taenzer et al disclose that the activator unit includes a connection device or fasten device from the activator unit to the

3.

induction loop to make a closed inductive loop when in operation (see figure 1A).

As per claims 10 and 20, as applied to claim 1, Taenzer et al in view of Peterson does not disclose that the garment includes a pocket. However, Peterson discloses that a garment worn by a user can implemented with pockets for carrying out electronic devices worn by the user (see figures 4 and 5 and section [0027] in order to achieve a convenience. It would have been obvious for a person skilled in the art to implement Taenzer et al invention in view of Peterson, as taught by Peterson, in such a way that the garment worn by the user (see Taenzer et al, figure 1A) comprises a pocket for carrying electronic parts, such as connectors for use in the activator unit, if the uses wants to carry them along.

As per claims 12 and 22, Taenzer et al discloses that the portable device includes a radio device "FM transmitter" (see Taenzer et al, col. 3, line 66).

Claim 14 is rejected with similar reasons set forth above for claims 2 and

Allowable Subject Matter

4. Claims 4-6, 11, 15, 16 and 21 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Regarding to claim 4, none of prior art of record teaches or suggests that the electrically conductive fibers corresponding to conductive yarns which are metallic coated yarns, yarns that incorporate non-conductive fibers with metallic fibers, or yarns that are showered with metallic pieces, as recited in the claim.

Regarding to claims 5, 6, 15 and 16, none of prior art of record teaches or suggests that the electrically conductive fibers each comprises a central metallic core composed of an electrically conductive material, and an insulative overcoat composed of an insulative material, as recited in claim 5 and 15.

Regarding to claims 11 and 21, none of prior art of record teaches or suggests that the activator includes a zipper with conductive teeth for data/electric connection utilized to establish electrical connection between the

Art Unit: 2682

conductive fibers forming the induction loop and to provide an interface to at

Page 10

least one portable electronic device, as recited in the claims.

Conclusion

5. References Grever (6,208,740) and Lehr et al (5,793,875) are additionally

cited because they are pertinent to the claimed invention.

Any inquiry concerning this communication or earlier communications

from the examiner should be directed to Sanh D Phu whose telephone number

is (703) 305-8635. The examiner can normally be reached on 8:00-16:30.

If attempts to reach the examiner by telephone are unsuccessful, the

examiner's supervisor, Vivian Chin can be reached on 703-301-6739. The fax

phone number for the organization where this application or proceeding is

assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application

or proceeding should be directed to the receptionist whose telephone number

is 703-305-8635.
